

FOR IMMEDIATE RELEASE

Compeat Restaurant Management Systems Announces Compeat Back Office Software Based on Microsoft .NET

Austin, TX – November 6, 2006 – Compeat Restaurant Management Systems, the leading provider of restaurant back office and accounting software, announced that Compeat Back Office 5 will be available to existing customers by year-end and to new customers in the first quarter of 2007.

Compeat Back Office 5 is a Smart Client application written entirely in Microsoft .NET and represents a fresh new face on an already popular product. It has been re-engineered from the ground up for greatly enhanced scalability and performance. By using Smart Client technology, Compeat Back Office combines the best features of both web applications and Windows applications. It allows for remote access and high scalability, while at the same time giving the user a rich and responsive interface. Additionally, the need for certain client access licenses from Microsoft will no longer be needed, thus reducing cost of ownership and increasing ROI.

“Compeat Back Office will streamline their current business processes, and – because of the built-in processes within the software – restaurateurs will have the ability to grow their business without drastically increasing administrative costs,” said Harry G. Barkerding, Founder and CEO of Compeat Restaurant Management Systems.

Compeat Back Office 5 includes many new features, including improved searching and enhanced browsing and filtering. In addition, all reports have been completely redesigned using Microsoft SQL Server Reporting Services. Key reports can now be scheduled and pushed to designated staff members on a daily basis. “This latest release allows users to have continuous access to their business information, enabling them to make the right decisions at the right time and in the right place,” added Barkerding.

Integrated document imaging has also been added to Compeat Back Office, which allows a scanned image of an invoice to be attached to the receiving detail, allowing it to be viewed or printed as needed. Updates to Compeat Back Office are accomplished through the use of smart client technology. Updates are applied to the server in the Home Office, which will then automatically update all client versions.
